Spoken words are oral sounds, conventionally used, as tokens of our thoughts, feelings and emotions.

Written words are visual symbols, conventionally used as tokens of our thoughts, feelings and Emotions.

Letters are visual marks or characters used to Express or Suggest words.

If letters are used Exclusively as phonetic symbols, to accurately express spoken words, the writing is properly styled Phonographic.

Orthography is that system of word representation which treats letters, partly as

phonetic or sound symbols, and partly as ideologic or idea producing symbols. It contends, for instance, that the elements discarded by the tongue in the words right, rite, rrite, rright, should be retained in the written words, because they entered into the original, and hence, it insists, the true words, and are significant of the differences in meaning. Orthography also uses di- and triliteral combinations to represent sounds. Of consequence, the sounds of spoken words are not expressed, but only more or less proximately suggested. A brief history of orthography with its principles will be found on another page.

Words are monosyllabic when uttered with a single impe-

use of the voice; dissyllabic, when with two impulses; trissyllabic, with three impulses; polysyllabic, four or more impulses.

The true Radical words represent or express original ideas. Any word which cannot be, or which has not been, referred to some other allied word or words, must be considered a radical word, regardless of the time it came into use. The true radicals are the words of the original mother tongue, -- that spoken before Babel (babble). They are now lost, but their remains are yet recognised in the basic elements of words which sprang from them, and express the same, or ideas akin to those they expressed. A primitive radical, stripped of its vowel elements,

would be reduced to its basic El=
ements. The radical part of a deriv=
ative word, stripped of its vowel
elements, is reduced to its, themal
Significant
Elements. Such of these themal El=
ements, or their equivalents, in al=
lied words, as correspond with each
other, are supposed to be identical
with the basic elements of the last
original which gave them birth.

Derivative words are those
which spring from radicals, and
constitute the bulk of words in
use. A derivative word is simple
when monosyllabic, or when com=
posed of two or more syllables,
neither of which is a word, pre=
fix or suffix. A complex deriv=
ative word is one which contains
a radical element, conveying to the
word its central or themal sig=
nification, associated with one

or more modifying elements, called prefixes or suffixes, which diversify this signification.

Words are compound when formed by the union of two or more complete words.

A prefix is a significant element, consisting of a word or a part of a word, placed before a word or a radical element to modify its signification. The word or radical element it modifies is the thermal element of the word. The difference between a prefix and a prepositive letter as grammatic variants, is that the latter has no special signification, but simply varies the form of the word, and, according to the intent, its meaning, while the former has a comparatively uniform signification, and similarly modifies all thermal elements to a

which it is prefixed. Prefixes are simple and compound. A simple prefix consists of a single significant Element; as, OVERACT, EXACT, CONSTRUCT, EMIT, ADMIT, ANNEX, The prefixes, EX and AD in the first words contract to E and A in the second. A compound prefix is formed by the union of two or more simple prefixes; as, INEXACT, REANNEX, RECONSTRUCT, UNRECONSTRUCT.

A Suffix is a significant Element, consisting of a word, or a part of a word, added to a word or a radical element to modify its signification. The word or radical Element modified, is the theme of the word. The difference between a suffix and a subjoined letter as grammatic modifiers, is that the latter simply varies the form of the word and its meaning, as intended, while the former has a compara-

fairly uniform signification, and similarly modifies all themes to which it is suffixed. Suffixes are simple and compound. A simple suffix consists of a single significant element; as, MONEYLESS, SPITEFUL, SENSATION, SPACIOUS. A compound suffix consists of a union of two or more simple suffixes; as SPITEFULLY, SENSATIONAL, SPACIOUSNESS, SENSATIONALLY.

Themes may be modified by the joint use of prefixes and suffixes; as, OVERACTING, EXACTNESS, RECONSTRUCTION.

Generally, radical elements may be disclosed, by cutting off all prefixes and suffixes, but sometimes a contracted compound will remain which may defy further analysis.

It is the province of Grammar to classify words into parts of speech, and to prescribe rules for their use in the construction of sentences. "Good language, however, depends less upon the laws of grammar than upon practice and natural aptitude. A clear head, a quick imagination, a sensitive ear, go far towards rendering rhetorical precepts needless. He who daily hears and reads well framed sentences, will more or less tend to use them. People ignorant of the rules and principles of grammar, are often able to express themselves with tolerable accuracy."

Shaw, in his Outlines of English Literature, tells us that

the English language contains about 40,000 words, which he took the pains to count and classify, as follows:

20,000	Nouns,
40	Pronouns,
9200	Adjectives,
8000	Verbs,
2600	Adverbs,
69	Prepositions,
19	Conjunctions,
68	Interjections,
2	Articles.

The dictionaries name the parts of speech to which each word belongs, but it should be understood, that except interjections which really imply associated words, not expressed, no word becomes a part of speech, until it takes its place in the sentence. As there becomes such part as its syntax makes it — a noun, if it has the syntax of a noun, an adjective, if it has the syntax of

an adjective, &c.

In like manner words vary their significations, according to the parts in which they are presented in the sentence. The following clipped from a newspaper, is presented in illustration:

"A sleeper is one who sleeps. A sleeper is that in which a sleeper sleeps. A sleeper is that on which the sleeper runs while the sleeper sleeps. Therefore, while the sleeper sleeps in the sleeper, ~~the sleeper~~, the sleeper carries the sleeper over the sleeper under the sleeper, until the sleeper which carries the sleeper, jumps the sleeper and wakes the sleeper in the sleeper, by striking the sleeper, and there is no longer any sleeper sleeping in the sleeper, on the sleeper"

and also of the fact, that other words in English, have many different significations — among them, blow, to which Webster gives twenty eight definitions, and, block, to which Johnson, it is said, gives about fifty — there seems to be very slight grounds for the claim to four different spellings for the words rite, right, write, wright, pronounced precisely alike.

We are told by Max Müller that some laborers in English parishes, have less than 200 words in their vocabularies; that the well-Educated Englishman seldom uses more than 4.000 different words; that Milton used only about 8.000; that Eloquent speakers, accurate thinkers and close reasoners, who avoid vague and general expressions, may rise to the command of 10,000 words; that Shakspeare, who displayed a greater

variety of expression than probably any writer in any language, procured all his plays with about 15,000 words.

An Orthographic alphabet is a series of letters sufficient in number to enable the writer to suggest, more or less proximately, the spoken words of the language. In English orthography, probably less than fifty words are accurately expressed; such as, so, no, he, we, be, etc. Chinese characters, like English orthography, have phonetic elements which suggest the sounds of the spoken words. The Chinese stu-

dent has this advantage however, over the English Student: The former, with the aid of his phonetic element, which suggests the Sound, and of the picture character which suggests the idea, attends only to the association of character, idea and word, while the latter, as he is usually taught orthography, wastes his time in attending to the association of the sounds of the Spoken words with their irrational literal construction, and with scarcely any reference to the ideas they represent. The consequence is, that though we have the noblest Tongue ever yet produced, the average English speaking individual is unable to express his ideas with becoming accuracy, and falls back on slang.

A Phonographic Alphabet should be monolateral — that is, it

should contain a letter for each simple speech sound, and also one for each compound sound of such frequent recurrence as to entitle it to alphabetic representation. The only limit to the number of letters proper to include in the series, is the capacity of the graphic materials to furnish distinct and facile forms of practical value. It is essential that the written and printed forms of a language should correspond. With a monolitteral alphabet, spelling or word construction is the literal expression of the word as it is pronounced, and proceeds with the same precision and accuracy as characterize numbers. The principal advantages to be derived from monolitteral expression, are, 1st The average adult student will be able to learn to read in a few

needs time; 2d, he can give the time he now largely wastes on orthography, to the study of analogies and definitions, and thus increase his capacity to express his ideas, and proportionately ascend in the scale of rational beings; 3d, instead of being ashamed of "bad spelling," so called, his native effort is in the direction of philosophical and consequently good spelling; he will be ashamed of bad pronunciation, and seek to correct it. He will not fail to provide himself with a proper Standard, and hence, we might reasonably expect the time to come, when English speaking People, Everywhere, will in truth speak one tongue; 4th, as he is not interested in Etymology, further than it will enable him to increase his stock of useful vocables,

he will not seek to penetrate beyond into the realms of Phylology. On the principle of the "greatest good to the greatest number," letters owe him this much. Professors of Languages, Phylologists and others will yet remain who will take care of the world's past linguistic experiences, and continue to draw valuable lessons therefrom; 5th. The causes which now operate changes will gradually disappear because we shall be able to more adequately use the ample means we now have of expressing our ideas.

Letter interchange properly belongs to Etymology, but as it forms the basis on which the author has constructed his monoliteral alphabet, the student should have some understanding of the laws governing it, and to this end, should have also some theory in explanation of the causes which produced the phenomena.

Ethnologists divide mankind into two distinct and broadly marked races — settlers and wanderers. As both are essential in her economy, she has never failed in any age or in any clime, — in the most barbarous communities, as well as amongst the rudest tribes of men, to produce both races in due proportions. Into the families alike, of the restless wanderer and of the home-loving settler, are born children, which inherit, in marked contrast, the characteristics of either race. The settlers are peaceable, industrious and provident, and in the rudest stages of society, are mostly herdsmen and tillers of the soil. The wanderers possess extraordinary powers of enduring privations, are comparatively insensible to pain, delight in warfare, and in the rudest stages of Society,

live on what they acquire by depredations on their own and neighboring communities. Dr Adam Smith, who made extensive observations, and a profound study of the habits of mankind, assures us that they "vary their speech, and adopt new words, with the intent of concealing their designs and exploits, and rendering their ideas unintelligible to all but members of their own community."

Here doubtless is the secret of what is called interchange — a word which does not cover all the features connected with the phenomena, though "variation" does

"Languages," says Skinner, "are not carved out by a senate of grammarians, but by the untutored, uncouth, rule-defying mob, that awful tyrant who has mutilated, butchered,

crucified, racked and wrenched, by all sorts of tortures, the innocent language." The work of the Scholar has been restricted to systemizing, polishing and refining language.

If it were possible to frame a language entirely new, it would not be impossible to enforce its sudden adoption by any people, to the exclusion of their mother tongue. But, variations of speech on the principles of interchange, are so easy; indeed, often natural, because organic. The vowel sounds in our little words the and to, are subject to considerable variation, in easy, natural speech. A following a light consonant in the same syllable, is organically changed to t; as, based, packed, mixed, stuffed &c.x Thomson is asked if he spells his name "with or without a d" because in pronunciation the organs

on account of new practices, agent
s, whether proper or not in the writ=
ten name. Thus, natural variations
doubtless originally suggested "variation
with intent" which are entirely arti=
ficial, but in harmony with natu=
ral laws. The result of artificial
variations to those left ignorant of
the principles regulating them, would
be, apparently "new words" and
"speech unintelligible." The first vari=
ation doubtless represented the identical
idea which the original word expressed,
and subsequent variations, modifica=
tions of that idea. Hence Etymology
assumes that resemblance and coin=
cidences in sounds and meanings,
between words, wherever found,
are evidence that such words
spring from the same original idea.
Such evidence, as our examples will
largely show, are to be found in all

language, and abundantly testify to the existence in the remote past, of one language spoken by all men — a common mother tongue. The words of this original tongue, now lost, constitute the true roots of all languages. Max Müller tells us that the Latin language can be reduced to about 300 roots; Fulda must count less than 400 in German; Count de Gebelin less than 400 in French; Fourmont 300 in Greek; Bayer less than 350 in chinese. Original words doubtless consisted of a few elementary articulations, chosen perhaps because of a fancied resemblance between sounds and things. In developed words, their remains rarely are found to exceed three letters, which fact renders it probable that they were all monosyllabic.

Vowels are those elements

of Speech which serve to unite Consonants and render them audible. Consonants cannot be uttered at all, except concurrently with Vowels. Vowel and voiced are words derived from the same radical, and are generally used as equivalents, or interchangeably as adjectives, but this is misleading. Vowel sounds are not necessarily voiced sounds. Within range they are as distinct in whispered as they are in voiced speech. In their formation the parts of the organs do not touch one another, but are more or less contracted, thus modifying the mouth cavity, and incidentally the sound passing through it, much on the same principle, that the size and length of the aperture of a reed modify the sounds they emit. Vowels are hence the euphonic and musical El-

ments of speech. That use as mu-
sical Elements is restricted to a few
interjections, expressive of the emo-
tions. They are largely used however,
as modifiers of the logical Elements
into grammatic forms; as, hie, hare
hoc; man, men; this, these, those; thi,
strike, stroke, struck, etc. Distinc-
tions based on vowels are, etymolog-
ically, without value. a, e, i, o, u,
w, h, and y, are used in English to
represent vowel sounds. When so used,
they are etymologically, the equivalents
of each other, and besides, any one
of them is the equivalent of any two or
more of them in combination, and
vice versa. Thus, when representing vow-
el sounds only, a is the equivalent of aa,
or ea, or au, or ay, or ah, etc; and
vice versa, as modifiers or variants
they may shift their position with ref-
erence to associated consonants — that

es, from a position before, they may be placed after or inserted between the consonants; or several words may be reduced to any less number, or one may be increased to two or more.

The Consonant Sounds of speech are the peculiar effects produced by the stoppage or interruption of vowel sounds during their passage through the mouth cavity. In the production of these effects, the organs are the instruments of the mind: Hence the consonants are the significant, & logical elements of speech. The palate is made to vibrate between the root of the tongue and the wall of the throat, directing the breath through the mouth or nose; the point of the tongue is made to vibrate, or strike against the teeth or gums, thus repressing or checking the issuing breath; the lips are made to strike each other

or partially close, and a stop or re-
tard the breath. The result is, the
consonant sounds, which are classed
in groups or families, according to
the organ chiefly instrumental in
their production. Those by the pal-
ate are called palatals or gutterals,
those by the lips, labials; those by the
teeth, dentals; by the nose, nasals;
by the tongue, linguals. Certain fam-
ily sounds are very similar, as
the organs are very slightly altered
to produce them. The pairs, k, g —
p, b — f, v, — t, d, — s, z — n, m —
are such sounds, and are called
cognate (same kind) sounds. The slight
ones between consonant cognates are due to
the adjustments of the parts and their points of
contact at the time of utterance, rather
than to any presence or absence of the voice,
as is generally enforced. P, for instance —
breathed sharply at the lips, but [illegible]

to "e" is one to the impression of the vocal, caused by the sinking of the tongue and consequent enlargement of the mouth cavity. We should remark in this connection what was intended to be said in another, that the principle which governed in the choice of forms for letters in the earlier alphabets are not now fully understood. Some of them were evidently suggested by nature. S is the type of the hissing serpent, B a picture of the lips, and N in Hebrew, a fair portrayal of a strongly aquiline nose.

As variants of the forms of words expressing allied or kindred ideas, consonants, like the vowels, are subject to transpositions, augmentations, elisions and interchanges, in the latter respect, as a rule, according to the principle of family equivalents. Any consonant element, whether consisting of a single consonant or a combined consonant, or of two or more consonants in combination, is the equivalent

of any other consonant element of the same family. W and y when they represent consonant sounds, are equivalents of palatals. Wh is generally the equivalent of qu. W sometimes represents palatal and sometimes labial. Wh, h, and y may be considered hybrids.

The most conspicuous violation of these laws is that due to the corruption of c and g, which runs almost parallel in many European languages. That of c, which originally had the sound of palatal K, but in English is largely given the sound of dental S or displaced altogether, is particularly deplorable. The English corruption is said to be due to the fact that during the fourteenth century the language was threatened with a disagreeable excess of guttural sounds, which the tongue then began to lengthen, reject or modify. These vicious gutturals are now recognized

in English Orthography as silent letters, and as a rule, the sounds of the modified gutturals, are those styled c and g, soft, heard in the words, cease, germ. A striking illustration of the corruption of c, is afforded in the changes it has effected in the name of the great Roman orator, Cicero. In Latin, the name was doubtless pronounced Kikaro; in Italian it is pronounced Chicharo; in Spanish, Thitharo; in German, Tsitsaro; in French, Sisaro; in English Sisero.

In the continental vowel scale I has the sound of E long in English. This sound blended quickly with a following vowel, glides into the sound we now represent with Y. Iacob and Yakh, Ioseph and Yosf, were formerly written for Jacob and Joseph. I and Y are palatal Equivalents only when they represent basic Elements of the palatal family.

From the principles we have

stated, and the Semitic, we shall further illustrate by illustration, it must also be kept, THAT THE RADICAL PART OF ANY DERIVED WORD IS ITS THEME; THAT THE CONSONANT ELEMENTS COMPOSING THE THEME ARE ITS SIGNIFICANT THEMAL ELEMENTS, ONE OR MORE OF WHICH OR THEIR EQUIVALENTS MUST HAVE ENTERED INTO THE COMPOSITION OF THE ORIGINAL WORD. WHEN WORDS ALLIED IN MEANING ARE FOUND TO CONTAIN ONE OR MORE SIGNIFICANT THEMAL ELEMENTS IN COMMON, THEY MAY BE HELD TO HAVE ORIGINATED FROM THE SAME RADICAL WORD. THE LETTERS THEY HOLD IN COMMON, ON THE PRINCIPAL OF EQUIVALENTS, ARE THEIR BASIC LETTERS. { ALL OTHERS ARE WORD IRKING, OR GRAMMATIC VARIANTS OR MODIFIERS.

The, original of the modification was probably one of the first words to come into use among men, it would probably have not only represented paternity but

As the Aryan expanded over by chief primitive supremacy, let us assume that P. and T. and their equivalents are the basic letters, and try the dictionaries for allied words — words of similar meanings — which contain one or more of these letters. We can give space for only a few of the hundreds found:

English, father, first, fore, over, upper, prince, prime, friar, pope, papa, parent, priest, parson, rabbi, abbot, patriarch, veteran, &c

Anglo Saxon —, faeder, frae, freo, frum, fryccea, abbod

Dutch, Vader, voor, over,

Danish, fadar, for, over, paap, pave

Icelandic, fadar, furr, frum, efri, yfir, fyrir, Páfi, abot, &c

German, vater, vor, ober, pope, Pfaffe

Greek, pater, pero, pro, upper.

Latin, pater, primus, pro, prae, presbo

French, père, pape, rabbin,

Italian, padre, prio, papasso, pieve,

Spanish, padre, papas, rabino,

Welsh, Tad, ffar, mi, brai, por pab,
Irish, {athair, for, prim, bar, breas,
Russian, {poki, ;
batia;
Polish, {prym, pierw, popi, papiez,
{opat, parock;
Hebrew, abi, phrah, rabbi;
Chinese, fu;
Chaldee, abu;
Arabic, {abuna, fara, bahr, rabb,
{badr, buabua, rukban;
Persian, {padar, fara, far, bar, ubar,
{bari, babu, pal, rkuban,
Sanscrit, {tatha, bahr, varya, para
{pur, pra, upari, mabhi.
Hindu, {fura, param, bara, bar, pro.
{upri, upar, bhopa, babu
Turkish, ber, papas, rukban,

Let us now try for words representing circularity or roundness, noticed first perhaps in the form of the sun, and the movement of ascending smoke. Assuming that ore are the basic letters, we give from the multitude found, the following.

English, circle, circlet, circuit, Circus,

circle, circulate, circumvent, circumference, cycle, cycloid, cyclone, cyclopaedia, cylinder, cingle, cincture, precinct, curl, wheel, whirl, whirl, whirl, roll, turn, twist, crescent, curve, curve, swing, swivel, crook, ~~crook~~ crane, crank, cruise, wrathe, writhe, wreathe, wriggle, wreck, wrap, girt, gird, skirt, sphere, spiral, garland, girdle, gyrate, rotate, tour turn, round, wind, coil, collar, hasten, orb, auger, etc. lolin, helical, globe, gimlet, final,

Welsh, { cylch, cylch, clwy, greuiaw, crwm, gwrd, gyrgyr, cwr, cacht, tro, troi, tron, turn, dorf, hwl,

Irish, grainne, cruinn, cruinne, fal;

Greek, { curos, choreuma, turnos, troclos, lelix, poleo,

Latin, gyrus, spira, sphaera, orbis

Sanscrit, gola, vol, vrt, vrtta.

Spanish, Orbe, esfera

Polish, { Kolo, Wkoło, okrąg, koliste, okrągły, sfera,

Arabic, { Khuld, holkat, dawal, yarak, rahuwig

Persian, { ghal, ghoshad, gelgasht, dera, dawran

Hindu, { Khalla, gol, ghera, warna, daira, dawran

Zulu Kafir, gumela, pohla.

French, sphere corps, tourner, tour, roue, Traquer.

The English words bear, carry and drag are doubtless derived from the same original idea. We may try for words containing either br, cr or dr, but will confine our selection of example words to br and Equivalents — and to English words:

Bear, bier, barrow, barrel, barge, barnacle, boat, bore, born, borne, birth, board, burden, bairn, baby, brat, bring, brought, brig, tribe, bridge,

bred, breed, broad, berry, freight, fetter, ferry, fruit & fruity, fecund, fertile, farm, fortune, fork, and hundreds of complex derivatives into which these words Enter as thenal elements.

The English words seat, sat, site are doubtless from the Latin original. Assuming st and their equivalents to be basic letters, we find that the following words which have similar meanings and corresponding basic elements — hence derived from a common original: Sit, sat, seat, set, settee, settle, saddle, sofa, see & a bishop's seat or jurisdiction; dissent, sorb, sorrow, cedar, sad, sedge, siege, session, sessile, sedate, sediment, situate, stool, stead, stand, stay, staid, steady, statue, still, stupid, stump, stumble, start, still, and hundreds of English complex derivatives into which these words Enter as thenes.

From English, Norse, and Old

for basic letters, are drawn the following words, each denoting something concerning the noise: moo, roar, bellow, moan, growl -- covering the order of the basics, we have, chant, croon, snort, sneer, sneer, sniff, snuffle, snicker, snarl, snort, snuff, and many complex derivations into which these words enter as themes.

If monoliteral spelling is better than diliteral — if Phonography is better than Orthography, why did the nations adopt, and why have they adhered to the latter?

The answer involves a consideration of the history and principles of Orthography.

The Phoenicians, if not the inventors of letters, were doubtless the first to make an extensive use of them. They possessed a commerce which extended as far East as England, and as far West perhaps as India. Their language must have been — only a few removes at most from the original mother tongue of which the language then spoken, constituted so many dialects. Dealing then-

rively with other nations, they had prob-
ably discovered the laws of interchange,
and hence understood and appreci-
ated the Consonants as the logical
Elements. Their alphabet consisted of
fifteen letters. Its suggestive power
was sufficient for, say, 5,000 words,
— as many perhaps as they Employed.
Owing to the peculiar Condition of lan-
guage at that time, more than two
or three vowels were not needed,
and so were found only to confuse.
Correspondents using their alphabet,
might write in a different lan-
guage — Hebrew, for instance — and
yet make themselves understood,
as the departure from the origin-
al tongue, owed not, among neigh-
boring peoples at least, have been
very great.

The Grecian Era followed.
The Greeks adopted the Phoenician

alphabet, but made such progress in civilization that they soon found it incapable of expressing adequately the words of their greatly increased vocabulary. Instead of casting it aside however they naturally sought to render it equal to the requirements of their tongue, by the addition of new letters. Linearity and curvilineas has doubtless already been established as essential features in alphabetic writing. With these as essentials and the Phoenician alphabet as the model, it was then, and remains to this day, an impossibility to construct out of the only graphic materials available, the same or more useful a mechanical alphabet for the Greek language. After the twenty fourth letter the Greeks stopped adding new letters to their alphabet, evidently because

Each, new forms became more and
more cumbersome, or tedious and
difficult to execute. They were forced
to adopt combinations of two simple
letters to represent the sounds for which
they had failed to provide alphabetic
expression, and here we have the
origin of dilateral expression, so
called. Our theory of the cause which
led to the adoption of this device is
sustained by facts as obvious as is
the result of the assumption that two
and two are four. If the reader can
fully appreciate the dilema in which
the Greeks found themselves, when they
attempted, as they doubtless did, to pro-
vide a monolateral alphabet for their
tongue, let him try to so amend the
English alphabet by the addition of
new letters of such form as which fit
into each other at the line of writing
as to read as a monolateral for the

English tongue, which requires about the same number of letters as the Greek. Except three letters — w a form of double u, j, which requires to be dotted, and u, which as ordinarily written is virtually a duplication of v — the English alphabet is the same as the Roman which was modeled after the Greek. True, the Greeks might have succeeded by extending the use of diacritic marks, which they invented, but they evidently refused to do this and abundantly exhibited both wisdom and good taste in their preference for digraphs. Our diacritic letters c and i are as many as we want in English, except for the use of cedilla and tilde.

As nations using alphabetic writing have adopted the Greek digraphic scheme, each modifying it to suit its own ideas of

Saxony. The English have adopted words from all other languages. It is said, and with truth, that their language has been aptly styled "the Mississippi of human tongues." If an adopted word does not suit their tongue, it is changed with a ceremony until it does, but changes of the written word to conform, are stubbornly resisted, because the written is deemed the true word.

The result of all this, is our hot-pot spelling called Orthography, which, to be at all consistent, requires us to spell in this fashion: B-e-t, bet, but suggests bet, so call it bet; b-e-a-t, be-ate, but suggests beat, call it beat; qu-i-t, quite, but suggests quit, call it quit; qu-i-t-e, quite, but suggests quite, call it quite; tough, unpronounceable, call it tuff. This is about as rational as would be the use of figures after the manner:

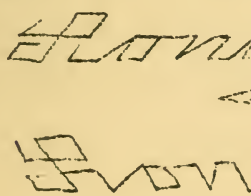
Two and two are four, but suggest forty, call it forty-five twenty and twenty are forty, but suggest four, call it four.

The answer to our question is briefly — We Greeks make a mistake which the nations adopted and have adhered to.

Graphic materials are the visual marks used to form letters. The letters in common use are styled script, and printed, plain, ornamental and other letters are modelled after them. The written and printed forms of a language, for obvious reasons, must correspond. Long-hand is the script style of writing familiar to all. The letters connect at the line of writing, and the easy flow of one into the other at that point, is favorable to the most rapid execution. Skilful penmen write, not only words, but whole lines without lifting the pen. In constructing the system of short-hand, he either has kept the important features, correctness and legibility, constantly in view, and believes that he has achieved

of each. The Carpet measure possible for short-hand, and thereby secured for the writer the greatest speed of which he is capable.

There are three styles of Long-hand, known as Running, Vertical and Back hand. To show the movement of the pen in each of these styles, we write, in angular letters modeled after carpet letters of each style, followed by the same word in Corresponding carpet:



The connecting links between the letters, it will be observed, are horizontal and inclined, the latter at about the same degree of inclination in each style. It is also well to impress upon the mind of the learner, that the hand naturally goes

more inclination to strokes formed by it with an upward movement, than to those, with a downward movement.

We find in the forms of these example words, all the materials used in Short-hand — the straight line, the curve line, the wave line, the circle. The dot may be considered a mere point beginning an imaginary line. In Long-hand the lines and circles are modified to conform to the line of writing, and the direction of the stroke, its length, and thickness are without significance, while in Short-hand, the writing must go in whatever direction the characters, correctly formed, take. In Short-hand character means one thing, a half-dot, another — a long one, something else — a lengthened long, yet another, a small circle, quite a different

from a large one — a flattened curve or loop something else; the straight, the curve, the grave, the thin, the thick, the horizontal, the vertical, the inclined, the up, the down strokes, each means something different from the other. It must now be apparent to the student, that although the letters of a short-hand alphabet are simpler in form than the letters of a long-hand alphabet, the former, for the reasons we have stated, are in lieu of expression, are greatly superior to the latter.

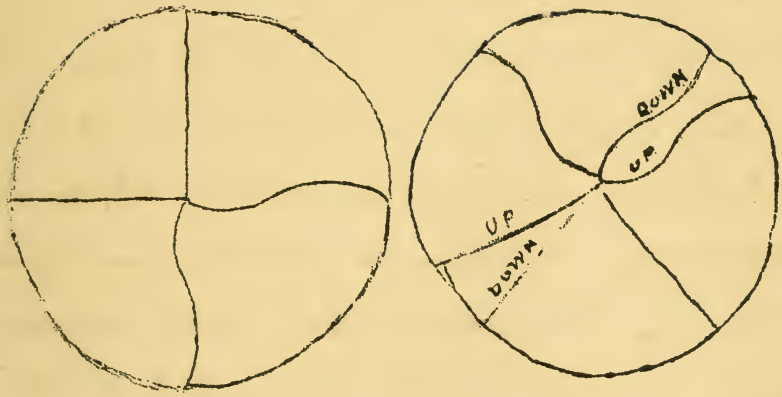
A line in writing is a mark connecting two points. In short-hand we have the imaginary line which is the course the pen would take, in directly connecting two points on opposite sides of the paper.

A line is direct from

from point to point, it is said to be straight; if the points of beginning and ending are identical, and the course of the line is at around another point, kept throughout at an equal distance, the form is a circle or ring; if the pen stop half way in its movement around such central point, the product is a half circle or deep curve; if the pen move in a curve, but take a shorter course from point to point than that traversed ~~by the pen~~ in the half circle, the curve is said to be more or less shallow or flattened, according to its deviation from the half circle. Flattened curves are the kind used in short-hand writing. A ring letter is a circle, followed by a connected stroke called its stem. Downward, the stems of ring letters, are invariably initial,

and there can be no hesitation in re-
cognizing them. THE RING IS THE HEAD OF
THE RING LETTER. If the ring of a ring-
letter is left open, or only half formed,
the pen-nib is a hook, large or small,
according to the size of the ring. HOOKS
BELONG TO RING LETTERS ONLY, A FACT
WE MAY TAKE OCCASION TO REPEAT, BE-
CAUSE IT MUST BE REMEMBERED, TO
RECOGNISE RING LETTERS IN THEIR
MANY TRANSFORMATIONS. When in the
formation of a ring, curve or hook
the pen travels in the same direction
as the hands of a clock, the move-
ment is said to be forward; when
it travels in the opposite direction
the movement is backward. Curves
are joined by the same movement
— Thus — ⌒ ⌒ ⌒ ⌒ } { x Curves
joined by both movements are called
waves, thus — ⌒ ⌒ ⌒ ⌒ } { x Rings
that begin and end at points, as of

Equidistant from the line of writing, are horizontal strokes; those which begin and end at points in the course of any imaginary line, directly from the top to the bottom of the paper, are vertical or perpendicular strokes; those which lean towards the line of writing are inclined strokes. But little experience is necessary to enable the writer to readily perceive in a learning stroke, the direction the hand took in executing it, as the hand gives us we have already stated, three inclination to upward then to downward formed strokes. The uninformed student should study the following diagrams, until he is able to readily point out each of the strokes we have described.



A fine or hair line is one drawn with a fine point, or with very light pressure on pen or pencil. In proportion as a line is made heavy or thickened purposely, it is more or less shaded. We say purposely, because a line intended to be light but, by mistake or accident, made heavy, must nevertheless be accounted a light line. The Espe-

Pencil writer, in hurried work, may fail to secure many characters accurately, just to himself, at first, for, in fact therein is apparent, and hence for his reading, the writing is entirely legible. The advanced writer of this system, may largely dispense with shading. A soft pencil is best for short-hand as considerable skill is necessary to shade with an upward stroke of the pen. Use soft, unglazed paper, and for light lines, but little more pressure than the weight of a soft pencil would give, and very slight additional pressure is required to secure the necessary distinction for heavy lines.

There are four lengths of stroke letters. The standard length is called full length or long. The half's are about half the length of the long, — have also, half-length. Ring letters long

to these two classes only — shorts and longs — EXCEPT WHEN THEY LOSE THEIR INITIAL RINGS ○ WHEN THE SHORTS MAY BE HALVED OR THE LONGS LENGTHENED, IF NECESSARY FOR DISTINCTION. A halved short is called also a trill, and a lengthened long is also called a double length. The following are samples of the four lengths, which, whatever may be the standard, must be relatively maintained, EXCEPT AS TO RING LETTERS AS ABOVE STATED, otherwise there will be liability to Error in reading:

— — — — ////

— — — — ////

Rings are said to be large or small, Ring letters with curve stems of the same length and direction, represent cognate consonants, the small ring for representing the light sound of the pair and the large ring letter, the heavy sound,

thus, ⌒t, ⌒d — ⌒s ⌒z; ⌒p ⌒b, ⌒f, ⌒v; ⌒k, ⌒g, ⌒ch, ⌒j; ⌒r, ⌒l; — n ⌒ng, &c. preferable, they can be written with rings of one size; thus ⌒t, ⌒d, ⌒s, ⌒z, &c., indicating distinctions by the relative lengths of the stems.

Ring letters are subject to thirty-nine distinct transformations covering all the favorite consonant groups of English Speech; as follows:

1. Straightening its curve adds n, thus, ⌒nn, ⌒ln, ⌒tn, ⌒dn, ⌒fn, ⌒vn.

2. Waving its curve adds m; thus, ⌒tm, ⌒dm, ⌒fm, ⌒jm, ⌒km, ⌒jm.

3. Looping its ring, or reversing the course of the pen after forming its ring, without changing the curve, adds r; thus ⌒pr, ⌒br, ⌒tr, ⌒dr, or ⌒fra, ⌒thr.

4. Looping its ring and straightening its curve, or reversing the pen after forming its ring and then straight-

tening its curve, add l; thus ⌒ tl, ⌒ kl, ⌒ bl ⌒ sl; or ⌒ kle, ⌒ ple ⌒ slo

5 Substituting a small hook for its ring without change of curve, except to leave short for light, and long for heavy sound, prefixes t; thus, ⌒ tr, ⌒ tl, ⌒ tn, ⌒ tm.

6 Substituting a large hook, without change of curve, prefixes th; thus ⌒ tht, ⌒ thd, ⌒ ths, ⌒ thz.

7 Adding a small terminal hook without other change, adds st; thus, ⌒ rst ⌒ bst ⌒ nst ⌒ mst.

8 Adding a large terminal ~~hook~~ hook, without other adds sd; thus ⌒ rsd ⌒ ksd ⌒ psd ⌒ nsd ⌒ msd.

9 Straightening stem and adding small terminal hook with forward motion adds nt; thus, ⌒ pnt, ⌒ ent, ⌒ knt, ⌒ bnt, ⌒ jnt.

10 — Same as nine, except, large hook, adds nd; Thus ⌒ rnd, ⌒ gnd.

11 — Same as 9 except small hook with backward motion; add ns or nz; thus ⌒ nns; ⌒ sns ⌒ pns ⌒ dns

NOTE. — When stem letters do not take hook, BUT RING LETTERS ONLY TAKE HOOKS. This renders the characters in last example, and all similarly constructed, perfectly distinct.

12 Same as 11 except large hook with backward movement, add nst or ndt; thus ⌒ nnts, ⌒ snts.

13 Dropping ring and adding small terminal hook, without change of stem, add sh; thus, ⌒ nsh, ⌒ sh, See not following 11.

14 Dropping ring and adding large terminal hook, without change of stem, add shr; thus ⌒ nshr, ⌒ mshr, ⌒ sshr, ⌒ zshr.

15 Dropping ring, straightening stem, and small terminal hook, forward movement add x; thus,

> pt, > bt, > ft, > vt, < st — nt mt

16. Same as 15 except large terminal hook, adds d; thus — nd — md < td > sd

17. Same as 16 except small terminal hook, backward movement, adds s or z; thus, > nt — ls — ns nts

18 Same as 17 except large hook, adds nts or ndz; thus, > nts — nts, — mts, > pts.

19 Converting ring to small hook and straight stem, ~~adds~~ prefixes s; thus < st — sl, — sn — sm, < st > ss < sz

20 Same as 19 with small terminal hook, forward movement, adds nt; as < nt, > prefixes s and adds t; thus — snt — smt > sst > zgt > sot

21 Same as 20 with large terminal hook, forward movement, ~~adds~~ prefixes s and adds d; thus,

Read, Rod → and, → end.

22 Same as 21 Except small hook, with backward movement; prefixes s and add s or z, thus Pass Sps → sns ∿ sps ∿ sfs Peaks x Initial s hook may be either backward or forward. Remember again that hooks belong to ring letters only, and do not attach to main or plain stroke letters.

23 Same as 22 Except, large terminal hook, backward movement, prefixes s and add ts or tz, ds or dz; Thus → ~~ents~~ → Snts Pasts ∿ sfts

24 Substituting large initial hook and straightening return, prefixes s and add r; Thus → Snr → Snrt ∿ Sfrt ∿ Sfr ∿ Swr.

25 Same as 24 with small terminal forward hook, prefixes s and adds it; Thus → Snrt → Snrts

25 Same as 24 except, small terminal hook, backward movement, prefixes s and add- ns or ny; thus ~ spn, ~ snns

26 Same as 24 except, except, large terminal hook, forward movement, add- prefixes s and add- nd; thus ~ snd ~ spnd ~ nard

27 Same as 24 except large terminal hook, backward movement, prefixes s and add- nts, nd, nds, ndz; thus, ~ spnts ~ snnds, ~ nts,

28 Substituting small hook for initial ring, adding small terminal hook inside of curve, prefixes t and add- t; thus ~ mt ~ tst, ~ tmt ~ tst.

29 Same as 28 except large terminal hook inside of curve prefixes t and add- d; thus ~ tnd, ~ tpd, ~ tgd

30 Substituting large hook

for initial ring and adding small terminal hook, inside of curve, prefixes T, L and add C; Thus, ⊃ lnt, C lnt ⊂ ⊃ lnl

32 Same as 31 Except large terminal hook inside curve; Thus C thd, ⊂ ⊃ thnd, C thpd.

33 Same as 4 except small terminal hook added with forward movement, add lt, thus ⊸ nlt, ⊸ mlt, ⊃ pkt

34 Same as 4 except large terminal hook, forward movement; Thus ⊂ sld ⊃ kld, ⊃ bld, ⊸ mld

35 Same as 34 Except small terminal hook, backward movement, add ls or ls; Thus ⊂ sls, ⊸ nls, ⊸ mls, ⊸ ⊃ fals or false.

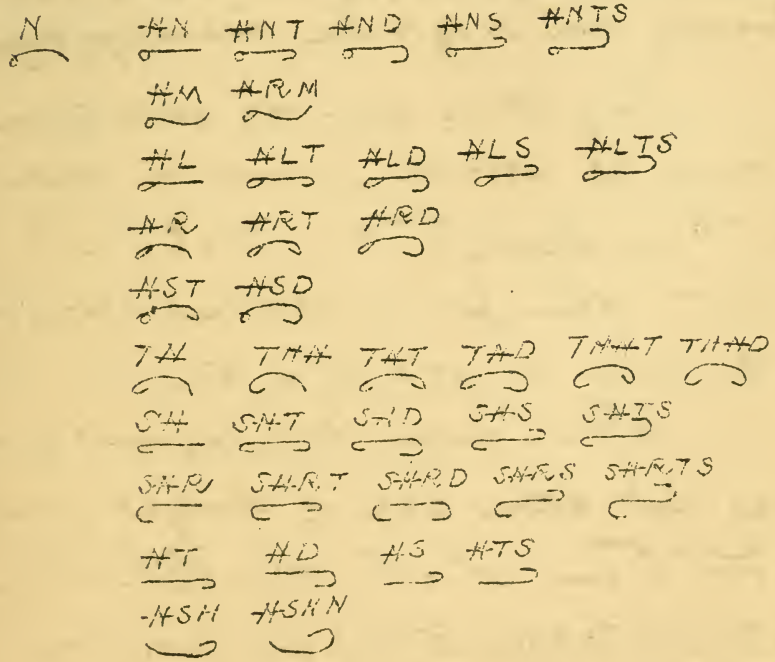
36 Same as 35 except large terminal hook, backward movement, add ts, dz, lts or lds; Thus, ⊸ nds, ⊂ ⊃ tds, ⊃ lds

37 Same as 3 except small terminal hook added inside curves, adds rd; thus ⌒ cart ⌒ mark ⌒ dark.

38 Same as 3 except large terminal hook, inside curves, adds rd; thus ⌒ prd, ⌒ lord, ⌒ board.

39 Reversing after forming the ring and changing the curve into a wave, adds rvng; thus, ∿ form, ∿ storm ∿ groom

VIEW OF THE TRANSFORMATIONS OF N.



The movement of the pen in Ring Letters, is from left to right, Thus

— ⌒ ⌒ ⌒ —

Perpendiculars, from top to bottom of the paper; Thus)) ? (

Inclines leaning toward the left, downward; Thus, \ \ ? ? ?

Inclines, leaning toward the right, either downward or upward. The following are struck

Invariably Upward c, e, d, b, b, t, th, sh, wh, ch

Invariably Down x, g, j, w, p, l, m, n, ng, ngs, th,

Ring Letters when used, then and may be struck forward or backward; Thus, Equal ⌒ ⌒,) = (, ⌒ = ⌒, EXCEPT, when pen is reversed after forming the main to add r, l, etc.

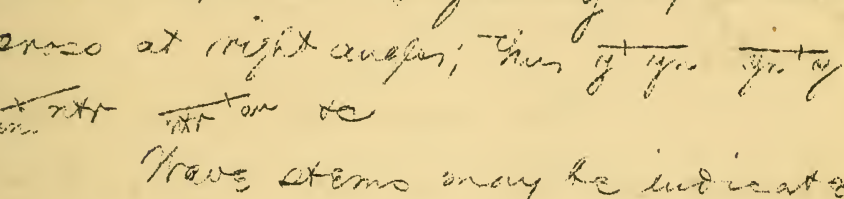
Initial hooks take the inside of curves and either side of straight stems; Thus ⌒ = ⌒ ⌒ = ⌒ etc REMEMBER—

HOOKS BELONG TO RING LETTERS ONLY. Never attach a hook to any plain straight, plain curve, or ANY WAVE CHARACTER.

Plain curves connect with an angle as do also waves; thus

Two straight lines meet indicate the point of joining by a short curve at right angles; thus

Wave stems may be indicated in the direction the pen takes in forming the circle following. Compare,



Capitals may be indicated by dots placed at such point as shall indicate the letter intended; thus Tom Smith

Vocalization is expressing, suggesting or indicating the word sounds of words.

Our word characters are the simplest strokes, selected to give facility to the writing, so far as possible, and are used, as are the word sounds in speech, to connect words and syllables, which may be joined continuously until a colon, dash, period or new paragraph is reached. No movement is without its significance. We have no rule of position — nothing except the punctuation marks stated, which renders it necessary to disconnect words. Phrasing may proceed until the writer reaches such point on the paper as he chooses to leave off and begin a new phrase. Lined paper is unnecessary,

as it are nothing to the legibility of the writing, which may be done by the experienced writer, in the dark or without looking at the paper.

Consonant sounds are announced, when the vowel sound succeeds; as, ap, ag, air, earth; announced when the vowel sound follows; as, pa, gay, pre.

Only one vowel, as a rule, is attainable for each word, and that should be the most suggestive, ~~sound~~, which as a rule, is the first vowel in announced sounds, or the first or last vowel in announced sounds. IN THE WRITING IT PRECEDES THE CONSONANT ELEMENTS of the word. The proper position is indicated, first, by the rule for denoting announced and announced sounds, — second, by the curve of the line, called the context. All vowel letter forms, without exception, and all other characters except those

which are specially shaped to represent other sounds, INDICATE ENOUNCED SOUNDS WHEN WRITTEN LIGHT, and ANNOUNCED SOUNDS WHEN SHADED; thus, pap fog, apple, able, nashun, com.n.cashun convocation, inspection defnashn, deglutition.

When necessary to connect a syllable it may be done by writing its suggestive consonant element, preceded by its vowel; thus, bladder, fondly.

When necessary, the final vowel of a word may be written, and is readily recognised as such, because the vowel following it belongs to the next word; as many men.

Vowels may be largely dispensed with in writing, but to what extent, depends upon the writer — his experience, familiarity with the

subject of his notes, ability from memory to utilize brief suggestive forms &c. Vowels are to be dropped, only as experience shows that they may be safely dispensed with. Short-hand in its briefer forms is a makeshift, and like hurriedly written long hand, is often decipherable only by the writer to whom it may be perfectly legible.

Most monosyllables may be expressed or fairly suggested, stenographically, by a single stroke followed by one or two letters, or by one of the contracted forms of ring letter, which, besides their simple combinations with the vowels, are subject to one hundred and twenty-four others, which are compromise covering many hundreds of the most commonly recurring words.

Not unlike the head of man in this respect the heads of words of two or more syllables, suggest their individuality more strongly, AS A RULE, than any other part. Add of the following elements, if necessary, as many only as are required to recall the word to mind.

The words thought, think, thing, are derived from the same original. Thought and thing are comprehensive in their meaning. The term thing may be used to designate each individual existence, simple or compound, whether it relates to object, occurrence or phenomena, or to existence, action, quality, condition, function, &c., be such object and its attributes, real, as when cognizant to our touch, vision or other sense, or imaginary, as when restricted to the mental and emotional experiences of our nature.

We are sufficiently accurate when we say that there are twenty distinct simple sounds heard in English speech. All are agreed as to the number of different simples, but as to the exact simples, some claim two or three more than others, of sounds having fine shades of difference. We can well afford to dispense with such as require a highly educated ear to detect. Twenty seven distinct sounds are sufficient. With only four of a series of ten figures one are able to form 9.999 numbers; with five, 99.999. Of course words are not formed on the same principle. There are certain favorite [illegible] sounds, also significant combinations known as roots,

corpses and suffuses, which enter into the composition. Even on the ground, the rapacity of beauty even comes to furnish words in inconceivable.

A simple sound is one that cannot be separated into two or more constituent elements.

There are 12 simple vowel sounds, which are usually grouped in families by lexicographers, and divided into long and short. These terms are misleading, as words are really long or short according to the stress or accent put upon them in utterance. In a monitonal alphabet every vowel has its name, which is its sound. A dictonal alphabet necessitates the use of marks to represent differences between the sounds it admits and those it excludes. Long, short, broad and Italian, are simply names

when used to denote distinctions between English vowels. The long sounds are the alphabetic name sounds — three simple and two compound — indicated in the following Table by a short dash over the letters. The short sounds are not alphabetically represented, marked by a short half circle over them. The broad sound is indicated thus ^ and the Italian thus, ˇ

TABLE OF ENGLISH SIMPLE VOWELS

A FAMILY.	ă ⟨at⟩	ā ⟨ate⟩	ă ⟨art⟩	â ⟨all⟩	
O "	ŏ ⟨odd⟩	ō ⟨oak⟩	o͝o ⟨foot⟩	o͞o ⟨ooze⟩	
E "	ĕ ⟨egg⟩	ē ⟨eke⟩			
I "	ĭ ⟨it⟩				
U "	ŭ ⟨up⟩				

Of these 12 simple sounds, only three are represented in the English alphabet. I long and U long, which are represented, are compound sounds, the former, by the blending of ă or ă with a following ē or ĭ; the latter, of ē or ĭ with a following o͝o

Two compound sounds sufficiently important to be entitled to alphabetic representation, are also excluded, but a sometimes orthographically represented by ou and oi. The former is a compound of ŏ or ă with a following o͞o; the latter of â with ĭ.

It is impossible to utter a consonant sound without the aid of a vowel. Indeed, vowels are shaped by the organs in utterance, and these shapes are the consonants. Learning to spell, or to name orally the letters forming a word, precedes learning to write. We must have names for letters to enable us to spell. It would no doubt help the student to teach him early that the alphabetic name of the letters, might change in the word. Instead, for instance of teaching him to say ar-ā-pe, rap, teach rā-ă-ăp, and so train until he understands the principles involved

This is no doubt the proper method of teaching Phonography, but it might not be adapted to Orthography.

The following table of simple consonants, numbering fifteen, is placed in family groups. Twelve of them form fifty pairs of cognates, each of which has its light and heavy sound, the former of which we indicate by a small half circle over them, and the latter by a short dash.

TABLE OF ENGLISH SIMPLE CONSONANTS.

Labials.	P̆,	B̄	—	F̆,	V̄	
Dentals	T̆	D̄	—	S̆	Z̄	
Gutterals	K̆	Ḡ	———			H.
Nasals	N̆	M̄				
Laynal	———					L R

The English alphabet provides ^ one or more letters to represent each of these sound. It also provides for the following Compound Sounds: J Equals dzh; Q = Kōō; W = ō, before vowels; Y = Ē or ĭ before vowels. X = Ks

The author finished writing his book on April 29. On looking over the pencils, he finds these two pages inadvertently left blank and as many other evidences of what may be taken for carelessness or unjustifiable haste, that he feels constrained to say this in Explanation:

From March 1874 to April 15, 79, as Book-Keeper and in other capacities, I have been in the Employ of The Singer Mfg. Co. On the day last named I received notice, that in accordance with the demands of the Home Office that Expenses should be reduced, it had been decided to dispense with my services, and throw my work on others who could attend to it. In consideration of my late service, I was generously accorded two weeks pay without being required to render service for it. I instantly resolved to bring out this work, and in this form as I had not the means to pay for Engraving and Printing. I had perfected the System about a year previously, and had partly written what was intended for

an exposition of them. As the responsible head of a family, the emergency required that I should bring out the work in two weeks if I could make the all important breaks and butter connections. It had also to be compressed within the narrowest limits, without the omission of any essential feature. Much of what had been written was struck out, and what remained was in such a chaotic condition that the whole work had to be rearranged, and besides this much new matter found, in illustration. The work as nearly conceived and elaborated, went directly upon the stencils. My hours of daily labor began at six A. M. and sometimes extended to one A. M. Only one hundred copies are to be issued, and all except paper and title page will be the work of my hands.

Under the circumstances the author begs that the purchaser will generously overlook the typographic, the many errors, and such other imperfections as may be naturally attributable to the haste he has stated.

St Louis,
April 30th, 89.

There are certain labialized consonants, ~~not yet~~ similar to Q-wō, which are not provided for alphabetically, but orthographically as follows: Tw-⟨=twō⟩ dw ⟨=dwō⟩ sw⟨=swō⟩ gw⟨=gwō⟩ wh⟨=hwō⟩ thw ⟨=thwō⟩ There are also certain aspirated consonants not provided for alphabetically but orthographically as follows: Th ⟨=th⟩ th⟨=dh⟩ ch⟨=tsh⟩ sh⟨=sh⟩ zh ⟨=zh⟩

Phonography is necessarily the basis of Short-hand. The student should first give his attention to the former until he is able to readily substitute phonographic for orthographic expression. We shall now give lists of words expressed in both forms, followed by the same words in Short-hand. Remember, we learn by comparing and taking notice of analogies & differences.

Phon. Cap. Ch — Sm. Let. ph.

Phon Cap N — sm Ltr n

Neu, osn, osn, osn, fon, nefer

Short-hand Letr ∫ struck upward ∫ Stroke for Cap ∫

A ring letter subject to the changes noted on pp 7

Orth Cap K — sm Letr k ∫ hard ∫

Kite, cat, school, look figue,

Phon Cap R — small Ltr r

Rze, rat, wrap, oer, fer

Orth Cap 'G' — small Ltr g Lt hand
Good, dog Egg, Gherkin, rogue,

Phon Cap G — sm. Ltr g
Ugly, beg, go, geese, ogre.

Shorthand Ltr 9 (Dot for Cap)

Orth Cap (none) sm Ltr (none) ch=tsh
Charm, much, match, Vermicelli
Ti and tu in Christian and culture, organically glide into a sound very similar to this, but Roemezas and Reaergo are doubtless preferable forms.

Phon Cap K sm ltr k
Kloe, ker, car, Kooeeeae

Shorthand Ltr) (Dot for Cap)
(A ring letter subject to the changes noted on pp)

Third Rep of Shorthand Letter (= sh)

Sun, mesh, medium, gorgeous, marriage, discharge, venture, soldier, grandeur. When sh and sh precede a vowel sound in the same syllable, they scarcely glide into the sound, in easy natural speech.

Phon Rep H — Shorthand Letter H

Few, age, ache, whose, saosh, voyage, usher, voashage.

Shorthand Letter J (dot for rep)

A SINGLE LETTER SUBJECT TO

Phon Rep K — Shorthand Letter K (= ks)

This sound is always preceded by a vowel.

Vex, lacks, oaks, exact, shaqus

Phon Rep Ya — Shorthand Letter Y

Yes, only, my, say, onion

Shorthand Letter Y (downward dot for Rep. of any letter subject to the Vowel noted on pg.)

Orth Cap X — small x <= gs>

When x precedes a syllable beginning with a vowel it generally goes into the sound.

Exalt, exist, exert, eggs, auger

Phon Cap Ks — small Letter x

Eggbox, Eggbus, Eggcup, Eggs, axe

Shorthand Letter g (down) or k (dot for Cap)

A ring after a consonant subject to the changes noted on pp 4 5

Orth. Cap Q small Letter q <= kw>

Quick, acquaint

This sound is often etymologically the equivalent of wh <hw> Qui? Quae? Quod? &c Who? Which? Where? What? &c.

Phon Cap W Small Letter w

Wet, awake

Shorthand Letter g (down) dot for Cap

A ring letter subject to the changes noted on pp 7

8 9

Wh Cap (rare) Initial (rare) = Wh
koo

Why, When, Whether — vaguely
interrogative. See remarks on koo.

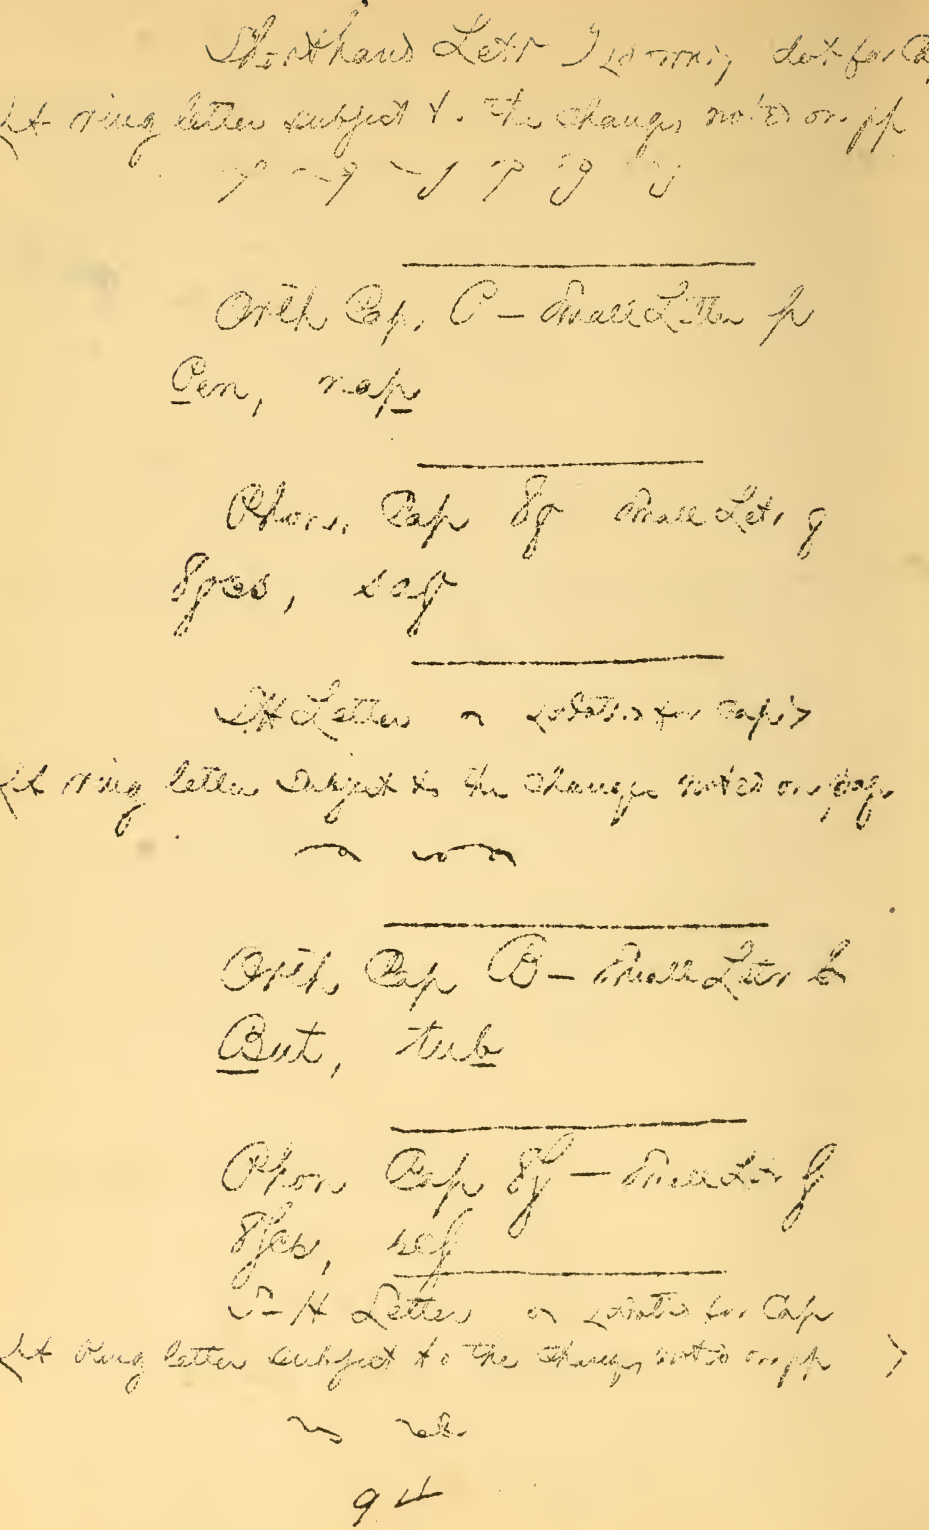
Phon Cap Zh Initial gr
Zhz, zhao, zheo

S-H Ltr (rare) dot for cap.
Let any letter subject to take the change denoted on ff
3 9 = 2

Ph Cap, H-Initial H (= to before vowels)
Always written in word and syllable except
when it forms part of a labialized consonant,
as hw, hv, hm or. Any consonant that is
unwritable may be labialized by adding the
round.

Hour, Walk, Next, Milk, Mind, Liquid

Phon Cap, G- Initial g
Gzs, ghs, gsk, gso, gzsk



Orth. Cap. F. Small Ltr f = Weak phy
Fat, if, physic, rough

Phon Cap. Ef — Sm. Ltr ef
Yes, ey yener, oef

Short-hand Ltr ⌒ <Dot for Cap.>
Lt ring letter subject to the changes noted on pp. >

Orth Cap V — Sm Ltr v
Vine, evil, nephew, Stephen

Phon Cap Ef — Sm Ltr ef
Yes, eyes, oeuf, Mr Eyes

S-H. Ltr ⌒ <Dot for Cap.>
Lt ring letter subject to the changes noted on pp. >

Orth Cap R - Sm. Ltr r
Run, rhetoric, fear, care, tree

In English speech Trilled r is seldom heard, and announced r in many of its Connections is quite unheard. Centre, Cafes, &c., are pronounced as if spelled sentur, cafur. It is doubtless best in such words to write them as if r had assimilated ŭ, rather than ŭ, r; Thus Centr, Cafr. The sound ŭ is organically injected between r and almost all words which precede it in the same syllable. It should not be written on this account alone.

Phon. Esp. O – Small Letter o

Boot, oshkosh, yes, not, lose

S-R. Letter – Letters for cash

Lt Ring Letter subject to the change, window-pay

Opt. Esp L – Sm Letr l,

Love, fall

Phon. Esp T Sm Letr o

Day, yoke

S-H Letter o Adapted for Copy 7

8th Rule G – Small Letter {g before words}

I sometimes represents the consonant sound of the letter, which as a consonant is always pronounced.

Get, gone, filial, Cognac, Cognac

Rule 9th Z – Small Letter z

Zeb, Zeo, geese, fuzz, razzle

Short-hand Ctr – Thin; Thicken to add r; Lengthen to add n; Lengthen and Thicken to add l; Thin – g, – gr – gn, – gl all pronounced.

Orthography

Thin, Thick, Thro, Thl

Rule 10th K Small Ctr. a

Kes, Cr, Clg, Cleo

Shorthand Letter (Dot for Ash
Mark thin for Unvoiced sound & thick for Unvoiced.

Oth Th ch

Then, there, other — a thicker sound than the preceding th.

Thus, Ash H — Small Ltr L

Has, Last, Clear.

Sh H Letter (Same as above)

Th Initial) is also provided for in the ring letter contractions. Example words in this and last paragraph may be expressed thus: ~ or ~, ~ or ~ ~ or ~, ~ or ~, ~ or ~, ~ or ~

Ash Sh, ch, Zh,

Ash, Shall, machine, special, ocean, conscience, mission, nation, Asian.

The sounds expressed by sē, sĭ, tē and tĭ generally elide into this sound when they pre-

and words in the same syllable.

Phon ~~Ch~~ Ch — Small Ch. as

Ark, hard, heard, upward, thick

heathen, Ethel, Esther, myself

Shorthand Letters { Thin Down, unmarked
Thick Down, unmarked
Thin Down, marked
Thick Down, marked

Commencing =

Orthographic ~~Gr~~ Gr, &c.

Figure, vision, glazier

Ch remarks on Sh

Phon Exp Ng — Small Ex. as

Finger, Uncle, Voyage

Shorthand Letters — same as Sh

We have exhausted our stock of Shorthand graphic material for English use. The principles on which our short-hand is based are applicable to any language. For foreign use it would be necessary to more or less, reassign certain the letters.

There is not any need of such change, however, as our Phonographic alphabet, as we have ample material left to provide for any of the European sounds we have omitted, so our alphabet may be made international in scope.

Phon. Capt. Cc — Small letter c may represent German ch. — heard also in Scotch, Irish, Polish and Spanish.

Phon. Capt. Mm or Ly Lloyd modified (like the figure 4) may represent German modified g. Small Letter as

Phon. Capt. Nn — Small letter n may

be used for German ü also heard in French and other languages.

Alm. Dap ß — small letter s may be used for German ß. as in pferd.

Alm. Dap Œ — small letter œ may be used for French œ as in sœur.

For Shorthand, Longhand Punctuation marks are used, but for short-hand, marks to represent the more frequently occurring dypo are selected with a view to giving the writing Regularity, so far as possible. For the Comma, use) or ~ Hook in the direction of the line of writing, terminating the word, and short of joining the pen. The comma stroke

are unchanged. For

Semicolons — use chain strokes like the commas, struck in the same way. For the ~~Colon~~

Colon — like comma terminating with a small ring, struck in the direction that will bring nearest to the line of writing, thus ∽ or ∾. If the last letter is a stroke letter, the ring may touch directly to the stroke, thus:

Like is short, unlike is long.

After a colon begin a new phrase

A TERMINAL RING IS NOT A LETTER, BUT A PUNCTUATION MARK TO WHICH YOU CANNOT ATTACH A FOLLOWING LETTER. For a ~~Dash~~

Dash, use a small terminal ring, flattened or lengthened, otherwise the same direction

for colon. For the

Period — use a large ter-
minal ring. To begin a
New paragraph, touch or flat-
ten the large terminal ring. For
Interrogation, use comma
mark ending with qu; thus Qd.
Continue to letter after this mark,
if desirable. For
Exclamation — use comma
mark with x, thus Cx. For
Parentheses — use comma
thus C C

Caught C Affirm C
Objection C Exception C

Accent is extension of
stress laid upon a syllable. Its
function is logical, when the object
is to denote the correct significa-
tion of the word; as Éde, Edé, Ægat

object', absent, absent'. Its function is euphonic, when the object is to render the word harmonious in cadence and measure; thus reprobate, colleague, benefactor, incongruous. Accent may fall on the radical syllable, as in present' incline', or on a subordinate one, as in, record, imprint.

Emphasis to the sentence is what accent is to the word. Emphasize successively the words and phrases in the following question, indicated by the figures 1, 2, 3, 4, 5, 6, 7, and see how many different answers are required.

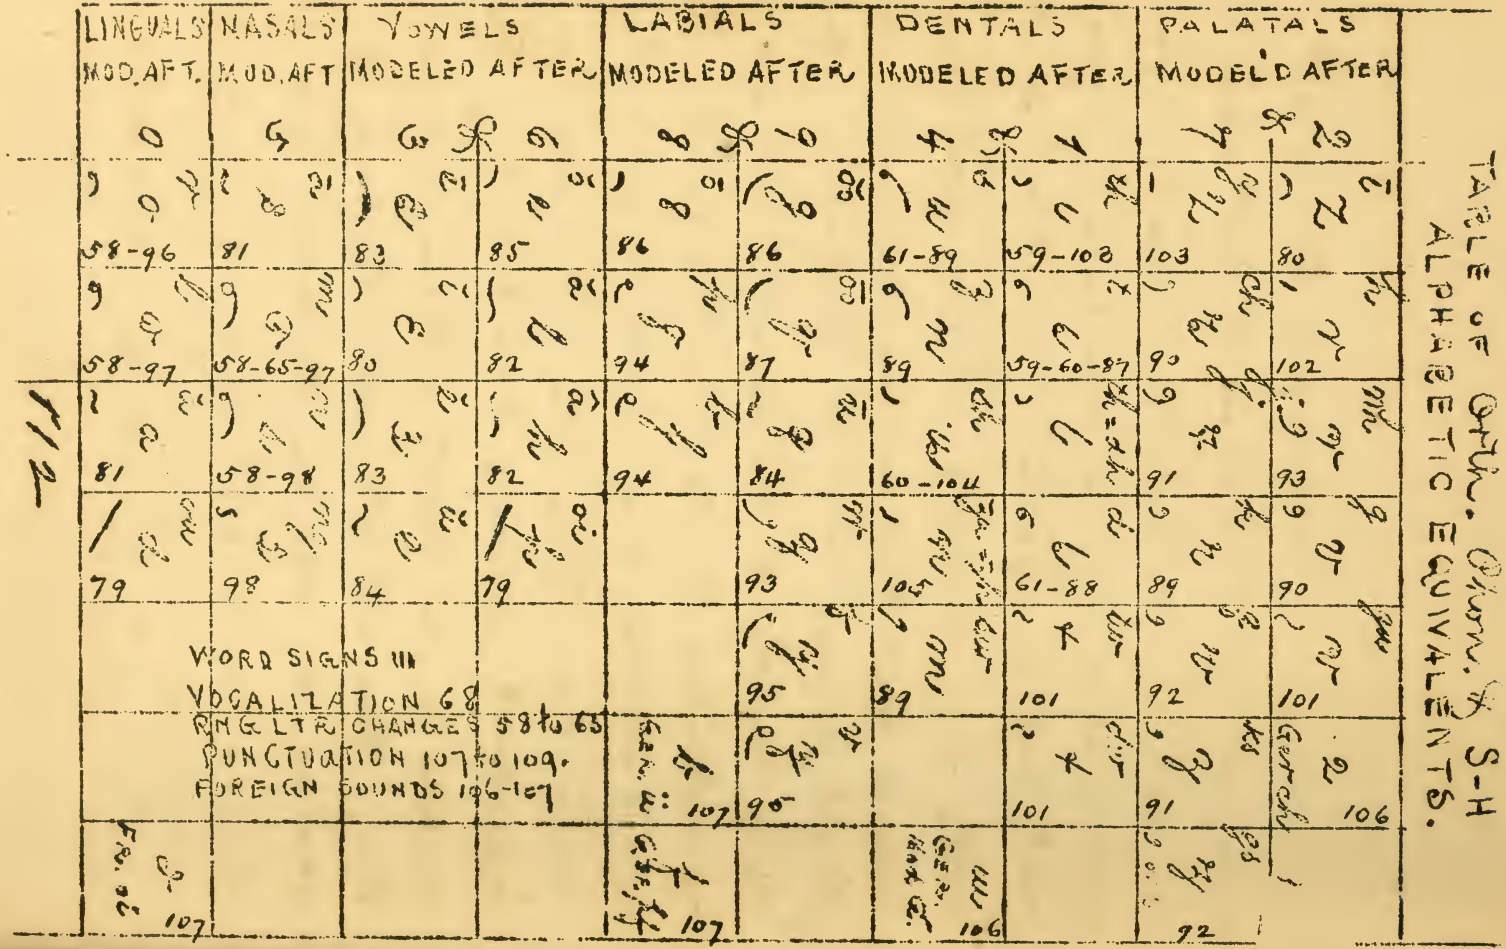
'Will you drive Dexter,
1 2 3 4
through the field, to town, today
5 6 7

We have only two word signs, as will be seen by the list which now follows. We take the pains to describe each carefully because it is important that the beginner of shorthand should write them correctly. The beginner should use a soft lead pencil with soft unglazed paper. For the light strokes, touch very slightly on the pencil — and carry by a feather to the right — and for the heavy strokes, only slightly increased pressure. These little words are very important, some of them indicating the direction of the word which follows them, thus and otherwise, keeping the mind to recall to mind freshness of the notes. The following are invariably the same, alternating as light and heavy:

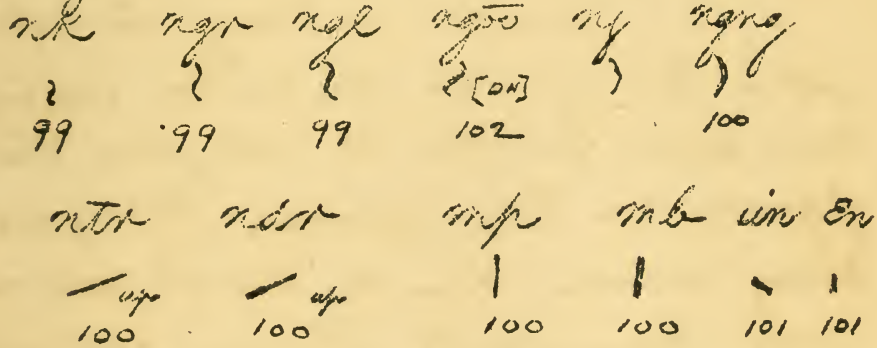
The — to — of — have — am — and — will — which —

On, down and right — In, down and right.

TABLE OF CURW. CHARS. & S-H ALPHABETIC EQUIVALENTS.



The following useful Alt letters are provided for compound words which are not represented specially in the foregoing Com. alphabet. For Examples of their use, see the pages indicated by figure under each character.



The words found among the consonant groups are, of course, not to be reckoned as belonging to them. The principles followed in the choice of terms for the letters, and their arrangement to place as in the alphabet were, that the more important words and ones suited to the shortest and most fa-

file forms, and that each form should take its place in the alphabet according to the figure after which it was modelled. Family words were referred to such figures as provide the requisite number of letters, and thus similar forms for similar sounds.

Our letters being modelled after the figures, the writer using them can learn to imagine the figures in their forms. Every word, every name, has its exact numerical Equivalent. This is a valuable feature which may be utilized in many ways. For card files, for instance, the name Jones = NOSH = 7654, suggests for this letter its exact place in a file arranged in numerically ascending order. If the file should be found to be too large to run consecutively, and hence, found best to divide it, Jones

11 4

place in the file would be, either 900 in the fourth division, or 98 in the 8th division, or 9 in the 2nd division. Names may be conveniently arranged on three plain sheets of 100 pages numbered from 00 to 99, forty lines to the page, with room from for 4000 names. 500 pages, so each, from 00 to 99 — 20,000 names. Any name on the 100 page index would come on the 84th page; on the 500 page index, it would come on the 8th half of the five pages numbered 84. If we would like to keep for future reference anything said about the Tariff = 2209 = 10089, or about Snakes = 1113 = 40819, or anything else, the name or subject suggests its place in the files.

The figures written opposite on the alphabetic page preceding this

refer to pages on which will be found examples of the use of such letters.

Graphic language, in one sense is written language — connected thought made visible on paper.

The author in these pages has endeavored to show what words are; how their meanings are varied by letter change; by prefixes and suffixes, by accent and Emphasis, by their use in the Sentence and the voice by which they are therein presented. He has also endeavored to point out and illustrate the differences between the vowels and Consonants as constituent elements of words.

These are the underlying principles of Language, more

important to be understood than Grammar, which as far as its Syntax is concerned is simply common sense applied to the choice and order and use of words as integers of sentences. Its orthography, however, is in defiance of commonsense.

The Student's first aim should be to understand these principles, and with them only in view, should read the book from beginning to End, passing over all that pertains to other matters. If one reading should prove insufficient, re-read until the object is attained.

Next take up Phonography. Turn to the alphabetic page, (112) and observe that the figures 2 and 7 are the marks for letters representing the Palatal Mutes; 1 and 4 for the Dentals; 3 and 9 for

the Labials; 5 for Nasals, 0 for Linguals, and 3 and 6 for Vowels. Observe in what respect each letter is alike or unlike the figure after which it is modeled, also likeness and unlikeness with respect to each other, and wherein the sound they represent are alike or unlike. Learn to refer each letter promptly to its model and to the group to which it belongs. As soon as able to do this, and without waiting to fully learn the power of each Phonographic letter, turn to the examples of orthographic and Phonographic spelling beginning on page 79 and compare the spellings. In doing this you will learn the powers of the Phonographic letters. Go entirely through this example and continue until

you are able to cover the Alphabet, Learn=
ing from view and readily and cor=
rectly reproduce them from their orth.
forms.

You are now ready to take up
Short-hand. Turn to the Alphabetic page
again, and give your attention first to the
Ring Letters only. Notice the direction in
which they are struck, and the differ=
ence the sizes of them rings. Learn to
relate each letter readily to the family
group in which it appears. Notice the
movements of the organs of speech in
uttering its sound, and you will soon
be able to do this. When you have ac=
quired, and without waiting to learn the
other letters, turn to page 65 and study
the 39 transformations of the ring letter
N, to each of which every one of
the other ring letters ~~are~~ is subject. To
clearly show what letters are added by
changes of its form, and their positions

before, after or both, we have struck a line through the n which the letter represents, and these remaining are the ones added, and will be added to any other ring letter by a like change of its form. Rings looped, or the pen reversed after forming them add l or r according to the stem. Rings converted into initial hooks, prefix s, t or th, according to size and the stem. Terminal hooks, forward movement (clock) add t or d, according to size, and backward movement s, z, th, tz. Terminal hooks, in lieu of curves add lt, ld, rt, rd, ft, fd, ch, chn, according as the ring is looped, or the pen after forming it is reversed or not reversed, or the ring retained or dropped. The forms largely suggest these changes, so it is not difficult to associate them in the mind. When this has been fairly done, turne again to the

examples of Phon and Orth spelling, and study the short-hand forms of the same words. Remember that one vowel only is admissible for each word, & the consonants which follow are sufficient to recall the word, but if not, as many more syllables as necessary may be added, each beginning with a vowel, UNLESS THE CONSONANTS JOIN EASILY WITHOUT THE VOWELS. The vowels otherwise ALWAYS PRECEDE AND CONNECT WORDS, their position, if initial, being indicated by a shaded consonant; if following the first, second or third letter, by unshaded consonants, as after G, st or str. in letter, steer, strait. The sense of the lines or context will generally suggest the correct word, but if any doubt, express the word more accurately. Go entirely through the list of example words in short-hand and write each ring letter form in its

Range as shown in the Table of
N transformations. As you proceed
you will also learn the vowel char-
acters, and other letters representing
announced and enounced sounds,
not provided for in the alphabet.
After going over and over these ex-
amples until you can cover them
from view, and reproduce them
from their Orth or Phon forms, turn
to the Reading exercise found on the
first pages of the book. If in read-
ing them, there should yet be found
something you do not understand,
read such portions of the book as you
think may furnish the explanation.
When able to read the S. H Version
fairly well, cover it from view, and
try to reproduce it from the Phonograph-
ic version. Now go through likewise
the Reading exercises at the End of
the book.

If the student is a fluent and intelligent reader of orthographic composition on topics of general interest, he should be able to learn to read fluently both systems (Phonic and DFT) within two months at the outside, and that without the aid of a teacher. Speed will come in proportion, as by practice, THE MUSCLES ARE EDUCATED to trace the forms, WITHOUT CONSCIOUS EFFORT ON THE PART OF THE MIND.

In conclusion, the author begs to add, briefly, touching himself and his work: For many years he was a writer of one of the many Stenographic systems of this Phonography — systems of Isaac Pitman and his disciples. As former the system answered him well, as a mercenary (Stellar Studies 4,050 word man Life, Page 167) — the ordinary mean of

business — with whose idiom and modes of expression he soon became so saturated as to enable him to do with the scantiest outlines, and often without any notes at all; but, when he essayed to follow the man of 10,000 words, his stock of word signs were totally inadequate, and the necessary number were not to be attained and retained, without entering the field of professional reporters and remaining constantly in it. Dr. Lindsley, in the Preface to his Tachygraphy, estimated at the time he wrote, that, of the 60,000 persons in this country who had bought Phonographic (so entitled) text books, "probably not more than 600 became expert reporters, probably a thousand more gained a degree of speed equal only to what they might have

acquired in a simpler, plainer style, while at least 498.000 failed to make it answer the end for which they sought."

Believing that short-hand could be so simplified as to be within the comprehension and ability of all capable of understanding and writing long-hand, the author began, about fifteen years ago, his life work, of which this little volume is the out-come. During the time he has sought and studied every system of short-hand within his reach, and has invented, written and discarded as many, perhaps, as a hundred different systems. His progress was laborious, and at times the chances of success appeared desperate, but in spite of all he was urged on by a hope that never quite deserted him, and a zeal that never flagged.

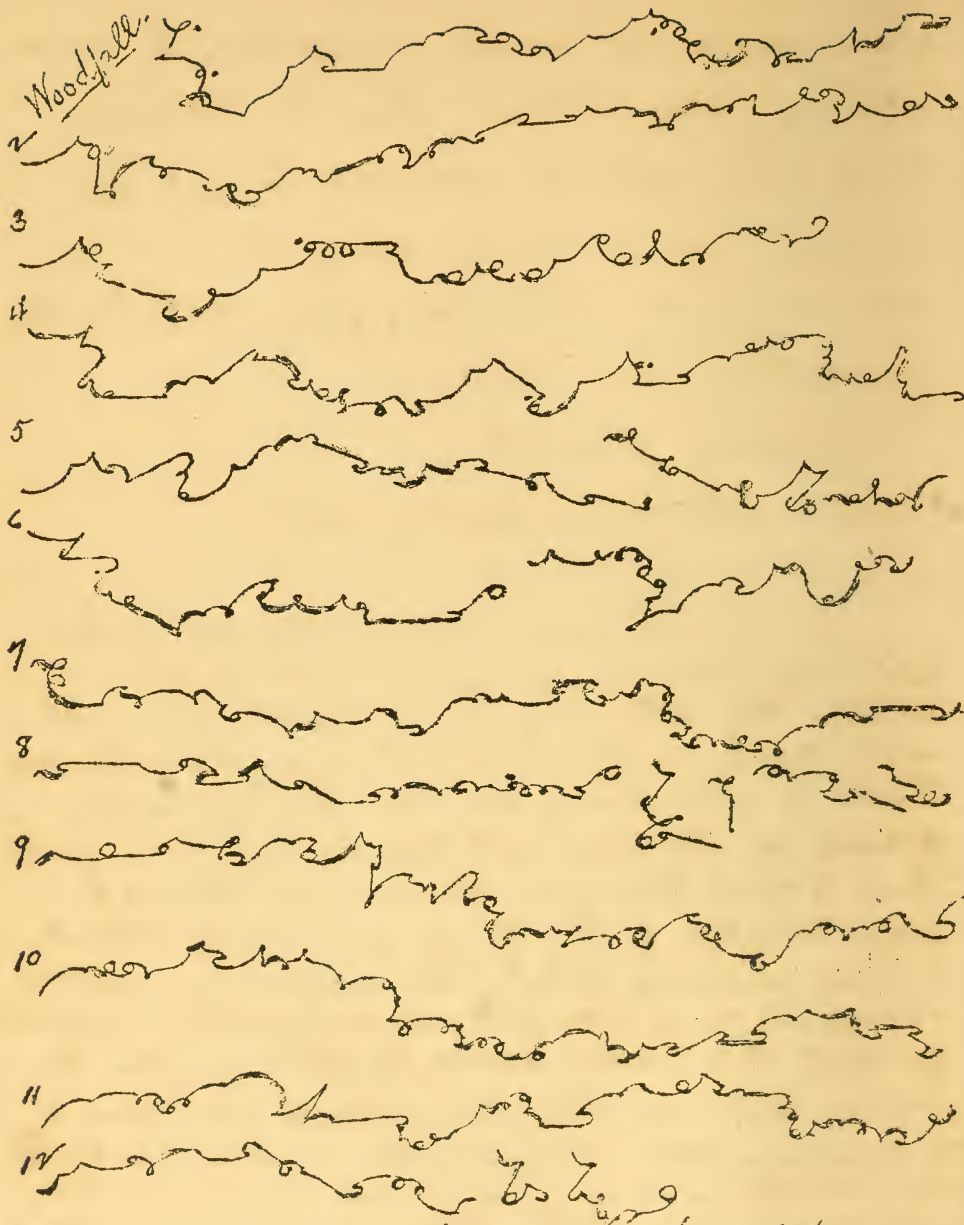
This system was approached by degrees, and in the end, amounted to a discovery.

Except letters, accompanying orders for his book, which should cover a money order, or registered remittance of $2.00 per copy, the author reserves the right to answer or leave unanswered, all other communications, unless the reception of his work by the public should prove so favorable as to furnish him with the necessary leisure. He will consider it A SPECIAL FAVOR, however if students of his system will write him their experience, or call his attention to anything he may have failed to make clear. He will also feel thankful for "marked copies" or just criticisms even of whatever form, whether

favorable or unfavorable. If unworthy, the author has no desire that his work should live; if worthy, it will surely survive all unjust attacks, from whatever quarter they come.

1612 Pine St
St Louis, Apl 29/1889

William Woodfall, the son of the celebrated Printer of the Public Advertiser, in which the Letters[12] of Junius first appeared, undertook, without assistance, the arduous task of reporting the debates[13] of both Houses of Parliament day by day in his father's paper. He was known to sit through long debates of the House of Commons, without making a single note[4] of the proceedings and afterwards to write out full and faithful accounts of what had taken place, extending often to sixteen columns. The remarkable assertions of this famous reporter,[5] gave the newspaper with which he connected a celebrity,[8] which compelled other papers to aim at the same fullness and freshness in their Parliamentary reports. What Woodfall accomplished by excessive bodily and mental exertion, his contemporaries succeeded in bringing to a higher degree of perfection, by the division[10] of labor, and thus, in time,

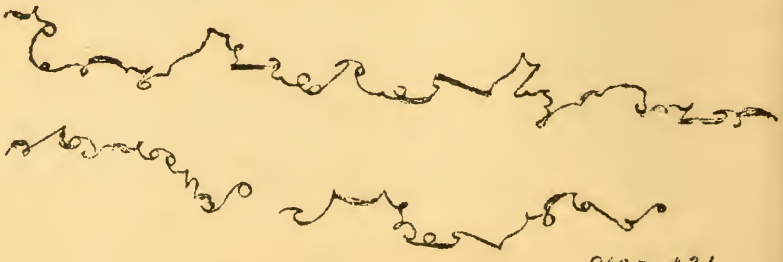


each morning paper, had secured the assistance of
an efficient body of Reporters, each of whom,
might in turn take notes of the debate, and com-
mit a portion of it to the press, several hours
before the whole debate was concluded

A journeyman hatter, on commencing business for himself, was anxious to get a handsome signboard, with a proper inscription. This he composed himself as follows: "John Thompson, Hatter, Makes and Sells Hats for Ready Money" with the figure of a hat subjoined. He thought he would submit it to his friends for amendments. The first he showed it to, thought the word hatter, tautologous, because followed by the word, "makes hats" which showed he was a hatter. It was struck out. He next observed that he thought the word make might as well be omitted, because his customers would buy, by whomsoever made, if the hats were good and suited them. He struck that out also. A third said he thought the words for Ready Money were useless, as it was not

the custom of the place to sell on credit, every one who purchased expected to pay cash. These were parted with and the inscription then altered: "John Thompson sells hats." Sells Hats! says his next friend. Why, who expects you to give them away? What then is the use of the words? It was struck out and hats was all that remained attached to the name of John Thompson. Even this inscription, brief as it was, was reduced ultimately to "John Thompson," with the figure of a hat subjoined.

THE HATTER.



INTERLINEAR VERSIONS OF THE LORD'S PRAYER.

Our Father, who art in Heaven:
Ado Yuco, ng Loe es Dieys:
Hallowed be Thy name: Thy kingdom come:
Dradzeb ge Noz Eso: Noz reches ras
Thy will be done in earth, as it is in Heaven
Noz gew ge bes es Eol, am es ames
on. Give us this day our daily bread:
Dieys. Dvey ou lew es do Beas Food.
And forgive us our trespasses, as we
Ask Yeovey ou do Eougauen, am ge
forgive them that trespass against us:
Yeovey Eso Eas Eougau Ewsus ou:
And lead us not into temptation; but
Ask oeb ou ses Ebg Eaegaseses, ge
deliver us from Evil. Amen.
Beazyo ou yoes Eyes. Closes

If the pronunciation in the following Phon. varies in foreign languages should be found to be not entirely correct, it will be no proof that our alphabet will not be as correct than Romance as accurately as it does English. Several foreign born citizens of Akron, read the Prayer aloud to the author, who gives the sounds AS HE HEARD THEM — PERHAPS NOT CORRECTLY.
